Date	Developer(s)	Change
April 4th, 2026	Felix Hurst	Initial version

1 Launching the Game

After installing the game as instructed in [INSTALL.md](#), you can launch the game at any time by running the executable file, or your shortcut that links to the executable. On some operating systems, you may encounter a warning popup, this is because our software is not digitally signed yet. These warnings can typically be bypassed to run the file anyway.

2 Playing the Game

2.1 Basic Control Scheme

The game is operated with keyboard and mouse controls. Controls are as follows:

- **Move:** WASD or Arrow Keys
- **Jump:** Space
- **Select Tool:** 1, 2, 3
- **Aim Tool:** Right Mouse Button
- **Use Tool:** Left Mouse Button
- **Reload Ammo:** R
- **Pause:** Esc or P
- **Interact:** E (only when near interactable objects)

For aiming tools, note that using the Right Mouse Button will toggle whether you are aiming or not, however, sometimes you may stop aiming if your character is no longer grounded. While aiming, point the mouse on the screen where you want to fire the tool.

The controls can also be viewed via the pause menu in-game, as long as you are inside a level and not actively viewing a cutscene.

Certain parts of the game UI also may contain buttons that you can click with your mouse, including cutscenes, the pause menu, and journal logs.

Journal logs provide additional information to you, the player, to help instruct you on what you can do, and provide hints on how to make progress.

2.2 Known Issues with Controls

Some users have reported issues with basic game controls. If some controls appear to do nothing, please try unplugging extraneous input peripherals from your PC (ex. game controllers) and relaunch the game. We have been tracking this issue, but it is not fully reproducible on our end, and so we have not been able to implement a permanent fix for all users.

2.3 Restarting Levels

If you ever feel that you messed up a puzzle too badly and need to restart the current level, or simply want to try things a different way for fun, you can restart the level via a button in the pause menu. This will reload the current scene.

3 Closing the Game

The game can be closed at any time. You can do this via a button in the pause menu, or you can use a key combination that your operating system uses to instantly close the active application, for instance, Alt+F4 on Windows.
